Activity Diagram

LAB 4 | Case Study: Food Delivery Application

Project Overview

The Food Delivery Application allows customers to discover restaurants, browse menus, place and pay for orders, track delivery, and provide feedback. Restaurants manage menus and incoming orders, while delivery partners accept assignments and update delivery status. An administrator supervises users, restaurants, payments, and operational issues.

Department of Computer Science & Engineering

1. Aim

To model the workflow of a customer placing and tracking an order in a Food Delivery Application using a UML Activity Diagram.

2. Objectives

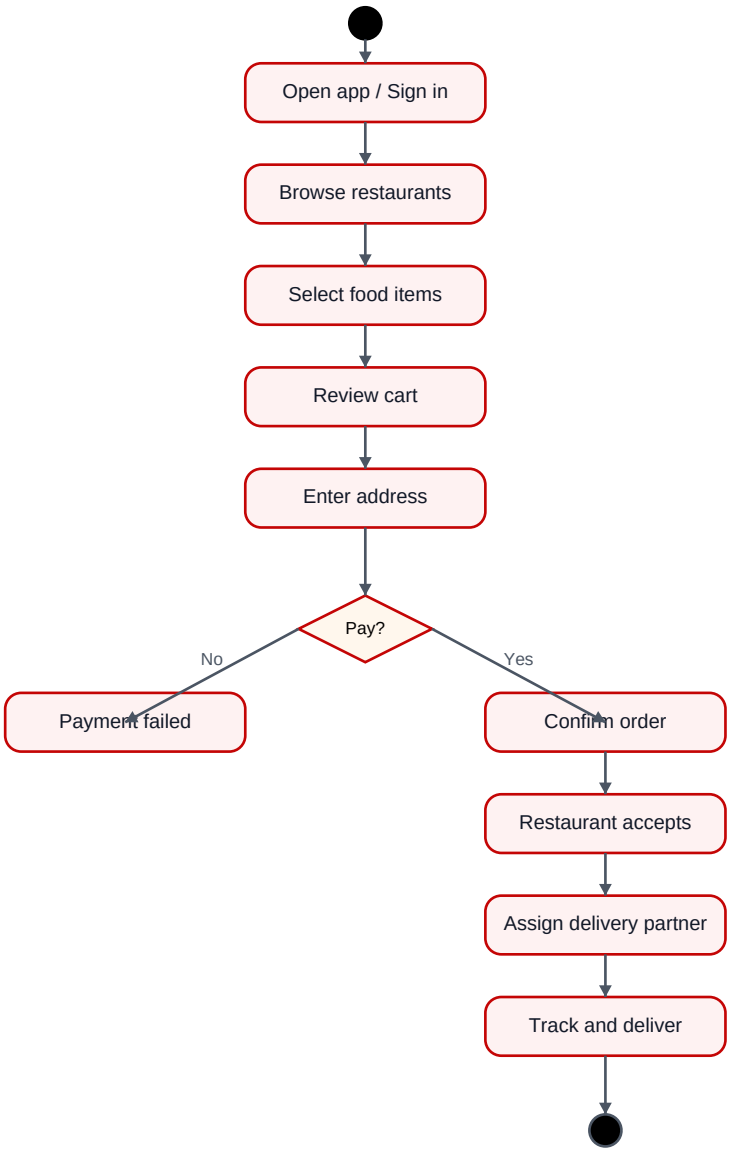
• Represent the sequence of activities from opening the app through successful delivery.

• Show a decision point for payment success or failure.

• Identify the main post-condition and alternate flow.

3. Activity Diagram

The flow below shows the main order journey. A real implementation may add branches for login failure, an unavailable item, restaurant rejection, cancellation, or refund processing.



Post-condition: order status is Delivered, Cancelled, or Payment Failed.

4. Result

The activity diagram represents the order-placement workflow and its payment decision, making the process and alternate outcome clear.
